
Personal Protection Fire Blanket

Information Sheet

Colan's Frontline Personal fire blankets are non woven and made from our PCA fibre, which is inherently fire resistant, will not carry flame and does not melt or drip, is acid & alkaline resistant, UV and solvent resistant. The blanket is lightweight and suitable to be kept in a car, truck, home or caravan. The Colan PCA blanket has been tested to the AFAC Personal Protective Blanket Specification Version 1.0, 2013.

The fire blanket can be utilised in emergency situations such as these:

- To cover over a person on the ground (with leaves and undergrowth cleared away) as a fire passes.
- To cover over a person crouched in a vehicle as a fire passes.
- Placed on the ground over flames to enable a person to cross quickly.
- As a shield to protect against flames and thermal heat with one or both hands.
- To extinguish a small fire if draped over the fire.
- To protect from sparks if cutting a person from a vehicle.

If clothing and boots are not fire resistant then the blanket will only protect those area covered by the blanket.

The blanket will absorb moisture so will soak up flammable liquids if in contact with them. If this happens do not use the blanket for fire resistance. The absorbed liquid if flammable will ignite.
